

We can observe two main properties:

$$(I) \quad p_{\psi}(\boldsymbol{\epsilon}) \text{ is independent of } \psi \implies \nabla_x \log(p_{\psi}(\boldsymbol{\epsilon})) = 0 \implies \mathbf{g}^{corr} = 0$$

$$(II) \quad T(\boldsymbol{\epsilon}, \psi) = 0 \implies \nabla_{\psi} \mathbb{E}_{q_{\psi}(\mathbf{z})}[f(\mathbf{z})] = \mathbb{E}_{q_{\psi}(\mathbf{z})}[f(\mathbf{z}) \nabla_{\psi} \log(q_{\psi}(\mathbf{z}))]$$
